

ART – Automated Rodent Tracker

This guide shows how to use the Automated Rodent Tracker, available for download at <http://www.trackers.brethewitt.net> and source code available at <https://github.com/BrettHewitt/ART>

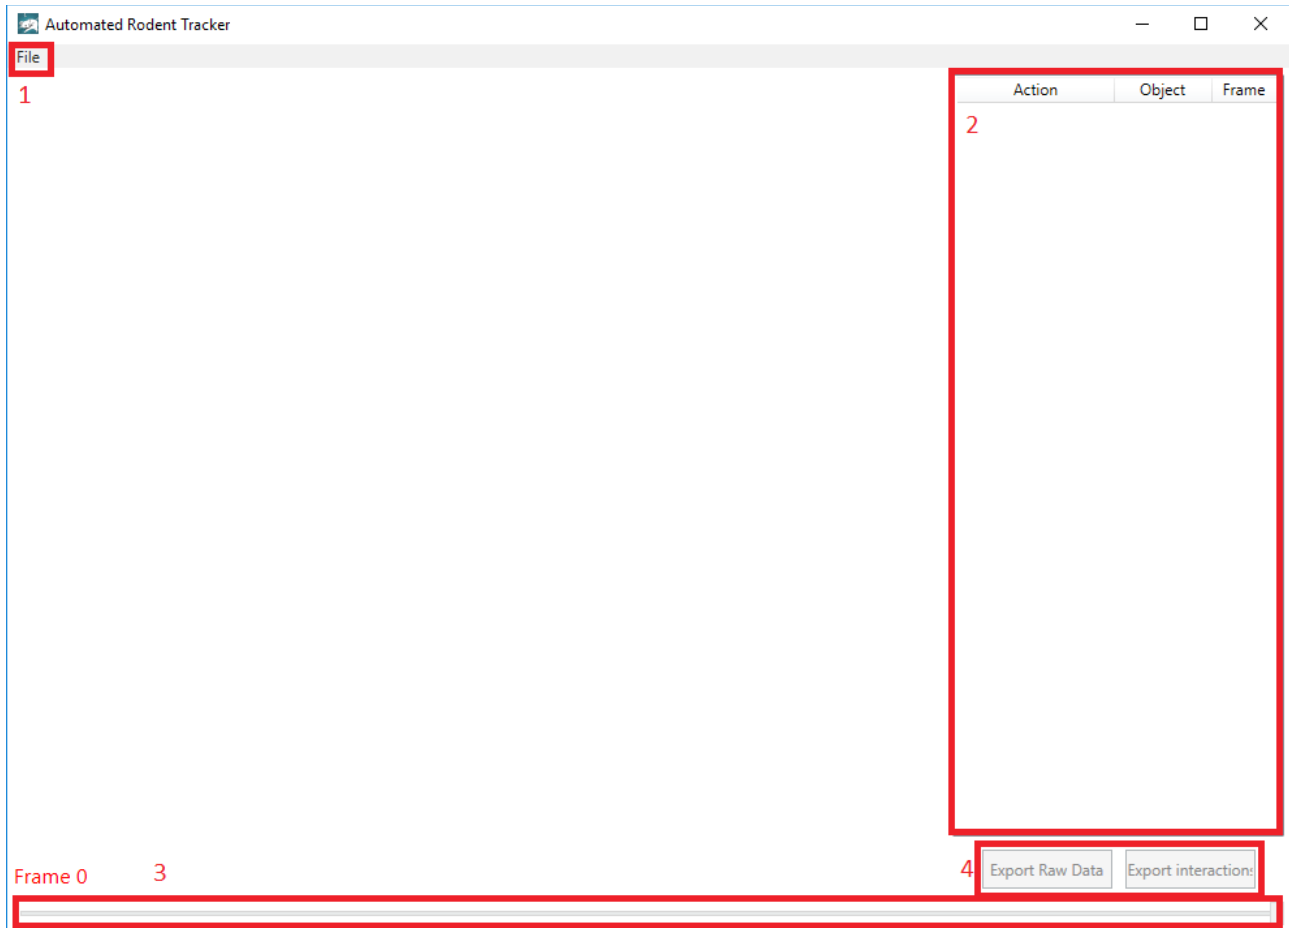

Fig 1 – Software Overview

- 1) File Menu
- 2) Behaviours Placer
- 3) Frame Control
- 4) Export Options

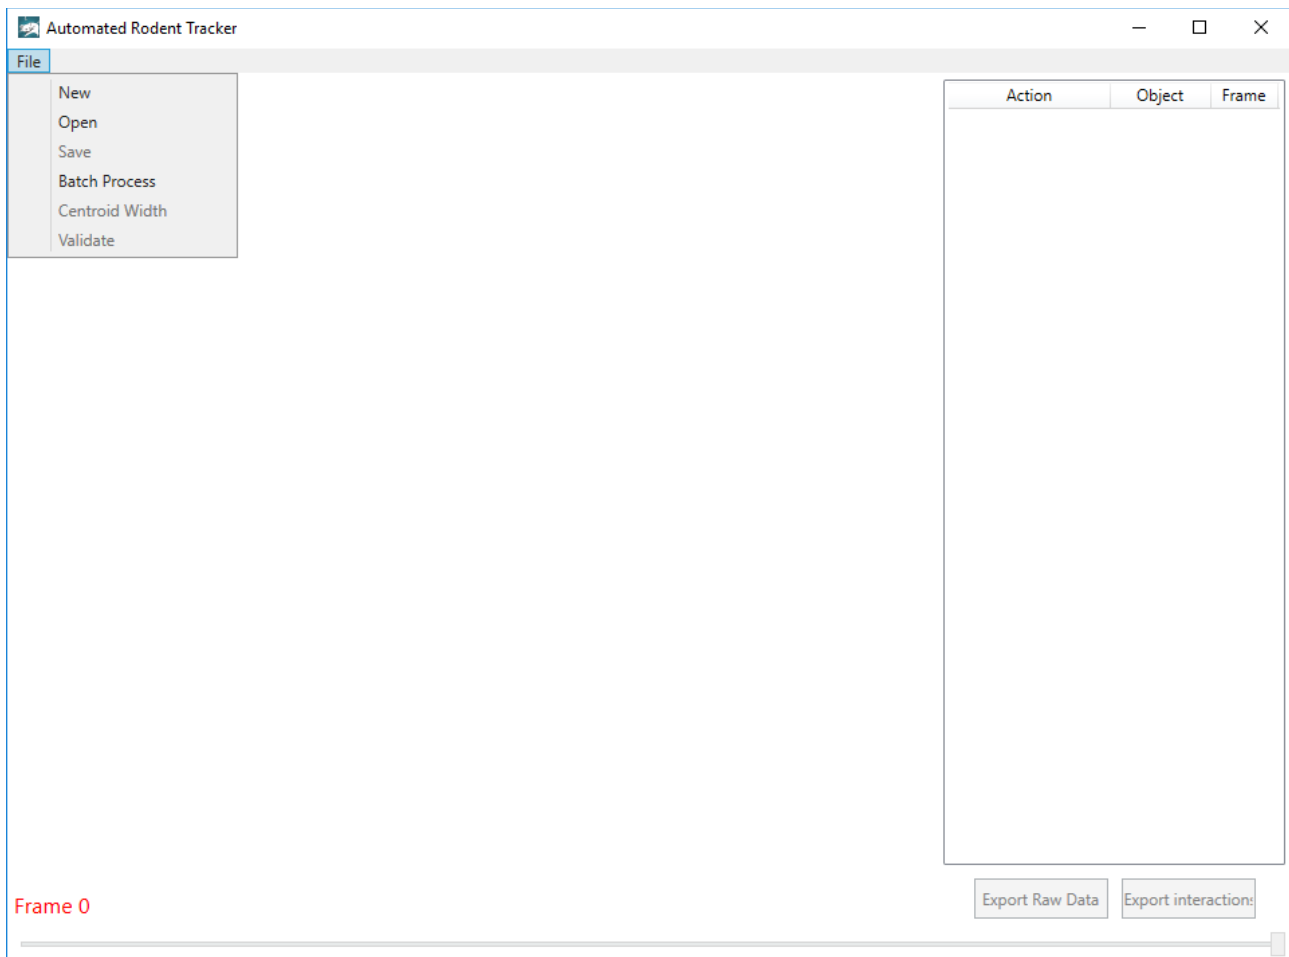

Fig 2 – File Menu

- 1) New – Start a new session
- 2) Open – Open an existing session
- 3) Save – Save the current session
- 4) Batch Processing – Opens the batch processing interface, used to process large datasets
- 5) Centroid Width – Opens the centroid width interface
- 6) Validate – Select an MWA file to validate the automated tracking against manual tracking

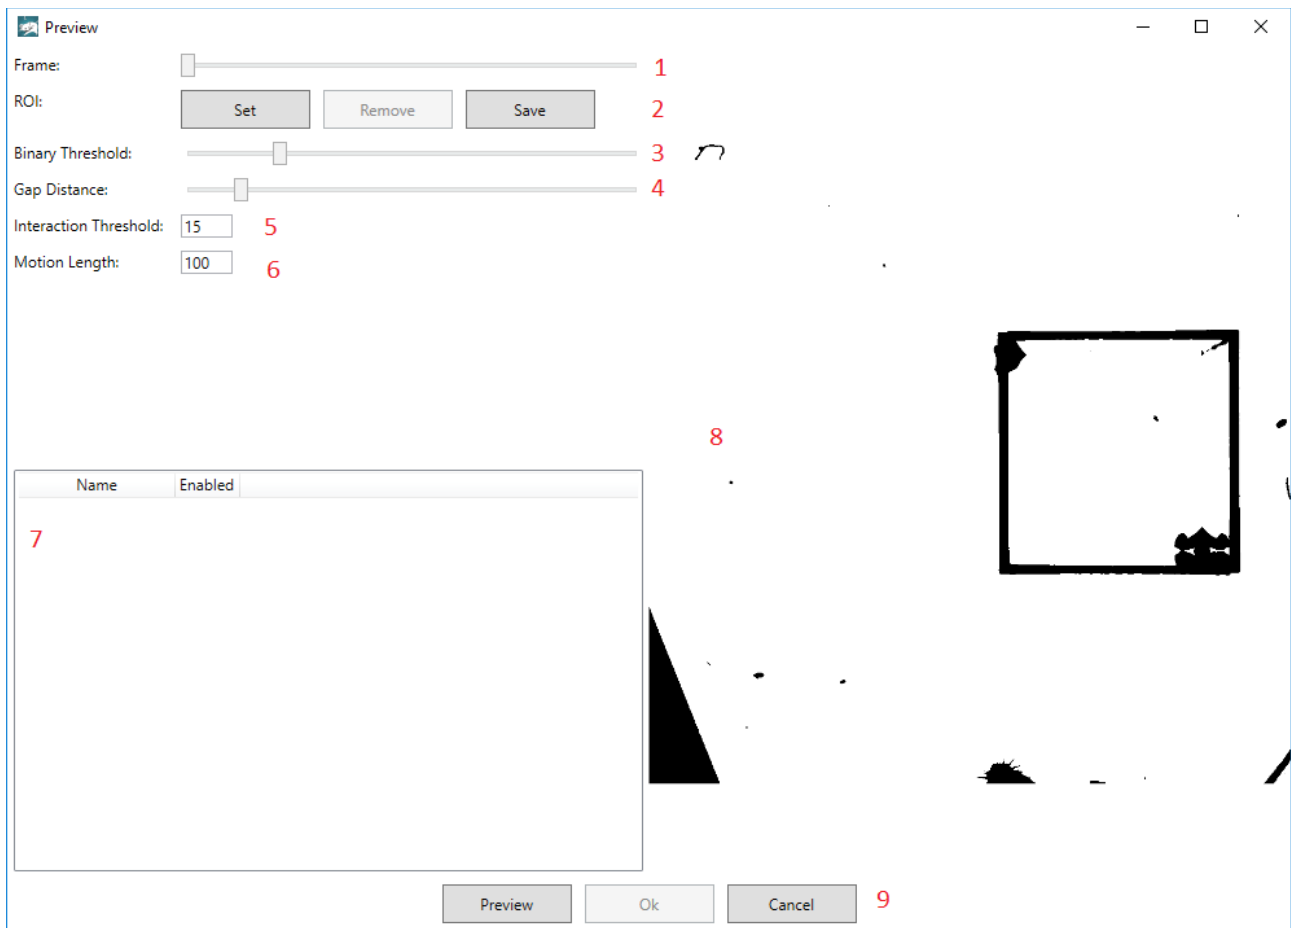

Fig 3 – New Session Settings

- 1) Frame slider – use this to select an appropriate frame where the mouse is visible.
- 2) ROI – Opens the ROI interface to select a specific region of the video to track
- 3) Binary Threshold – Determines the threshold level, NOTE THIS SHOULD BE SET TO THE LOWEST POSSIBLE VALUE WHERE EDGES ARE CLEARLY DEFINED
- 4) The gap distance between keypoints for nosetip identification, this can be calculated automatically by the software, but can be manually overridden by the user.
- 5) The distance in pixels for an interaction event to occur.
- 6) The motion length used to determine what is moving and what is static.
- 7) The detected boundaries, undesired boundaries can be removed here, or other boundaries can be renamed.
- 8) Visual feedback.
- 9) Process, Ok and Cancel buttons. Process must always be run first before the software can begin tracking.

Fig 4 – Example of incorrect Gap Distance

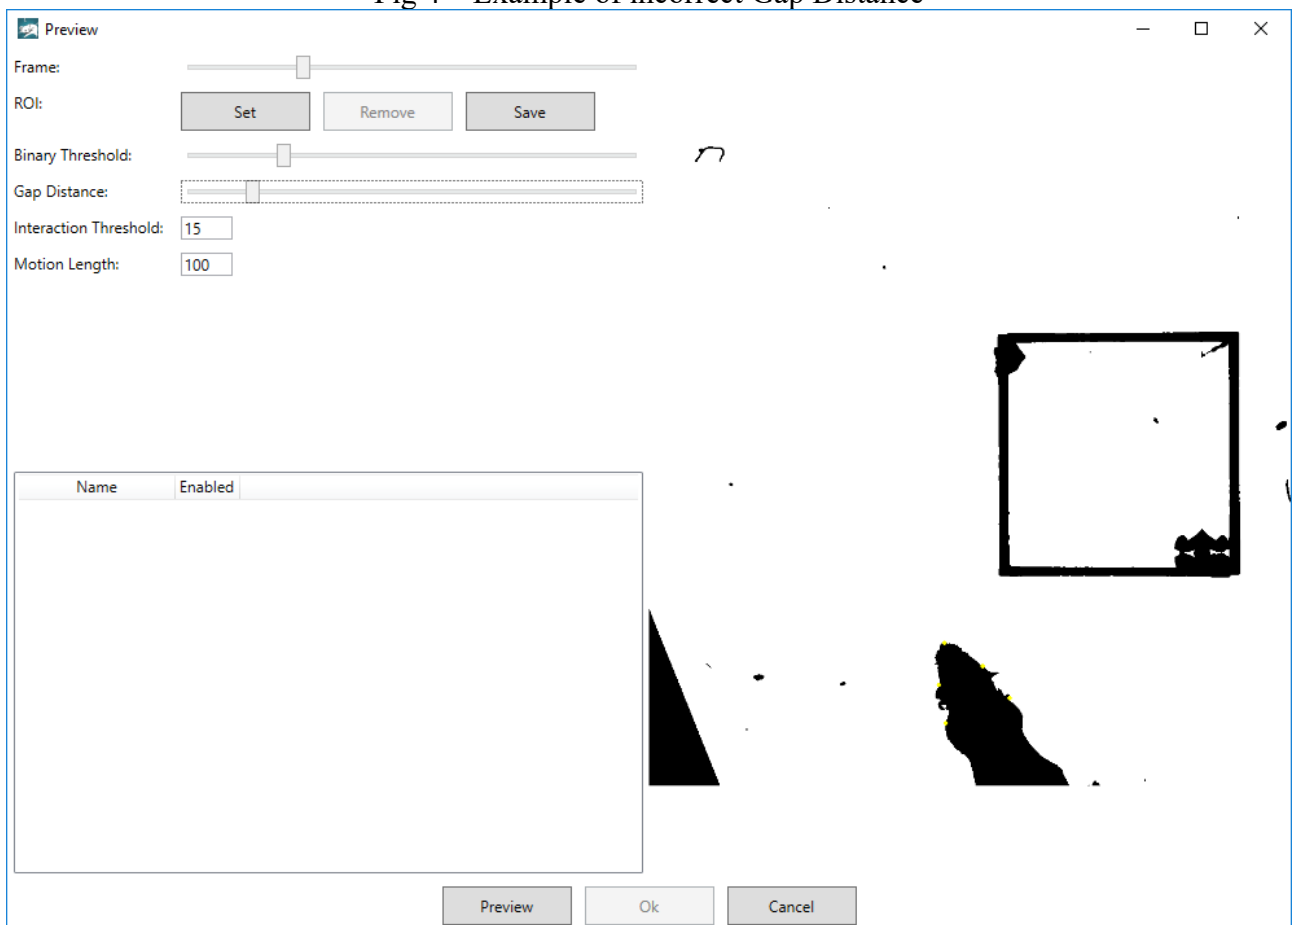

Fig 5 – Example of correct Gap Distance

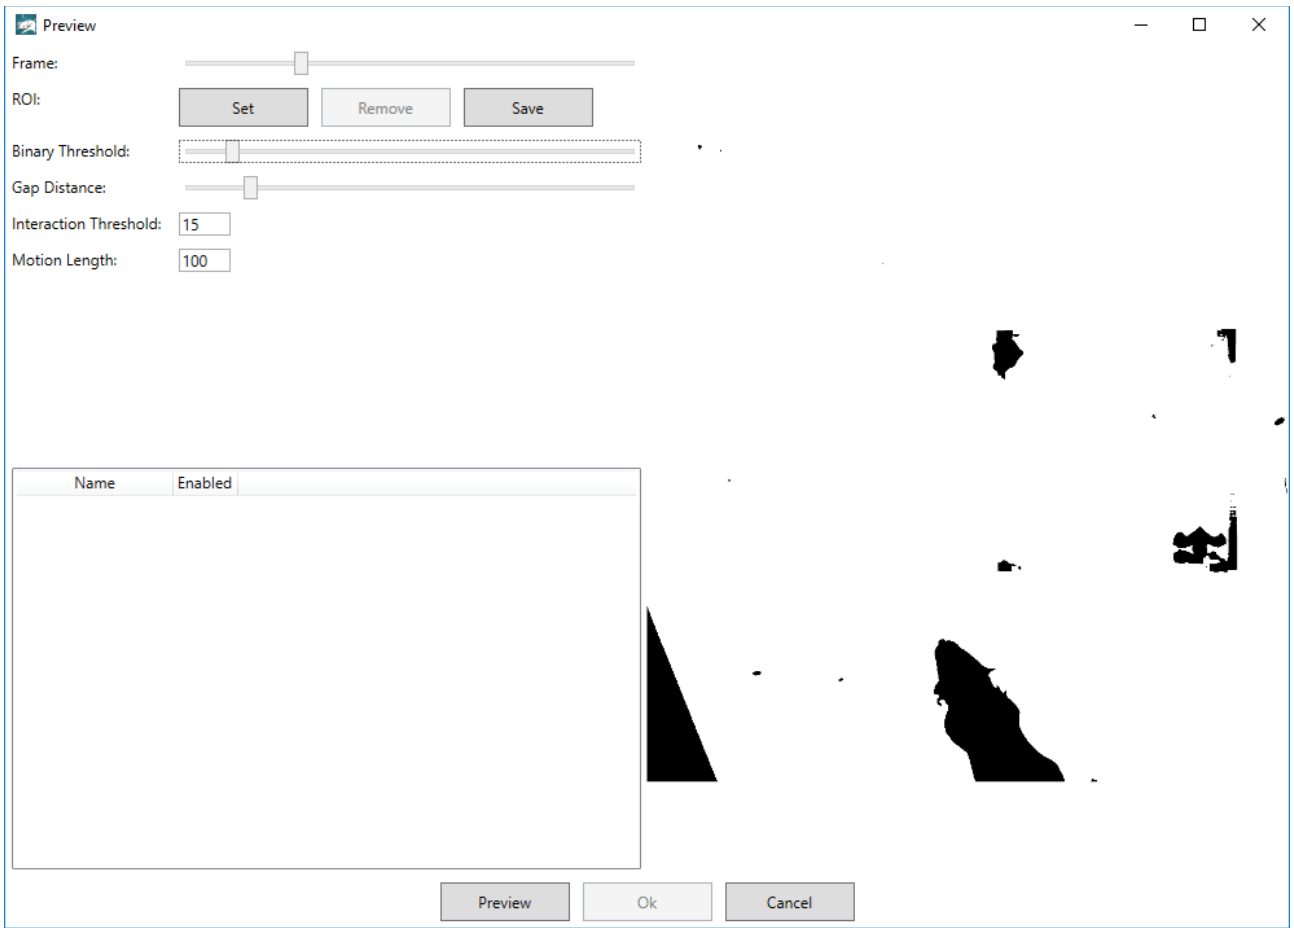

Fig 6 – Example of incorrect Binary Threshold

Fig 7 – Example of correct Binary Threshold

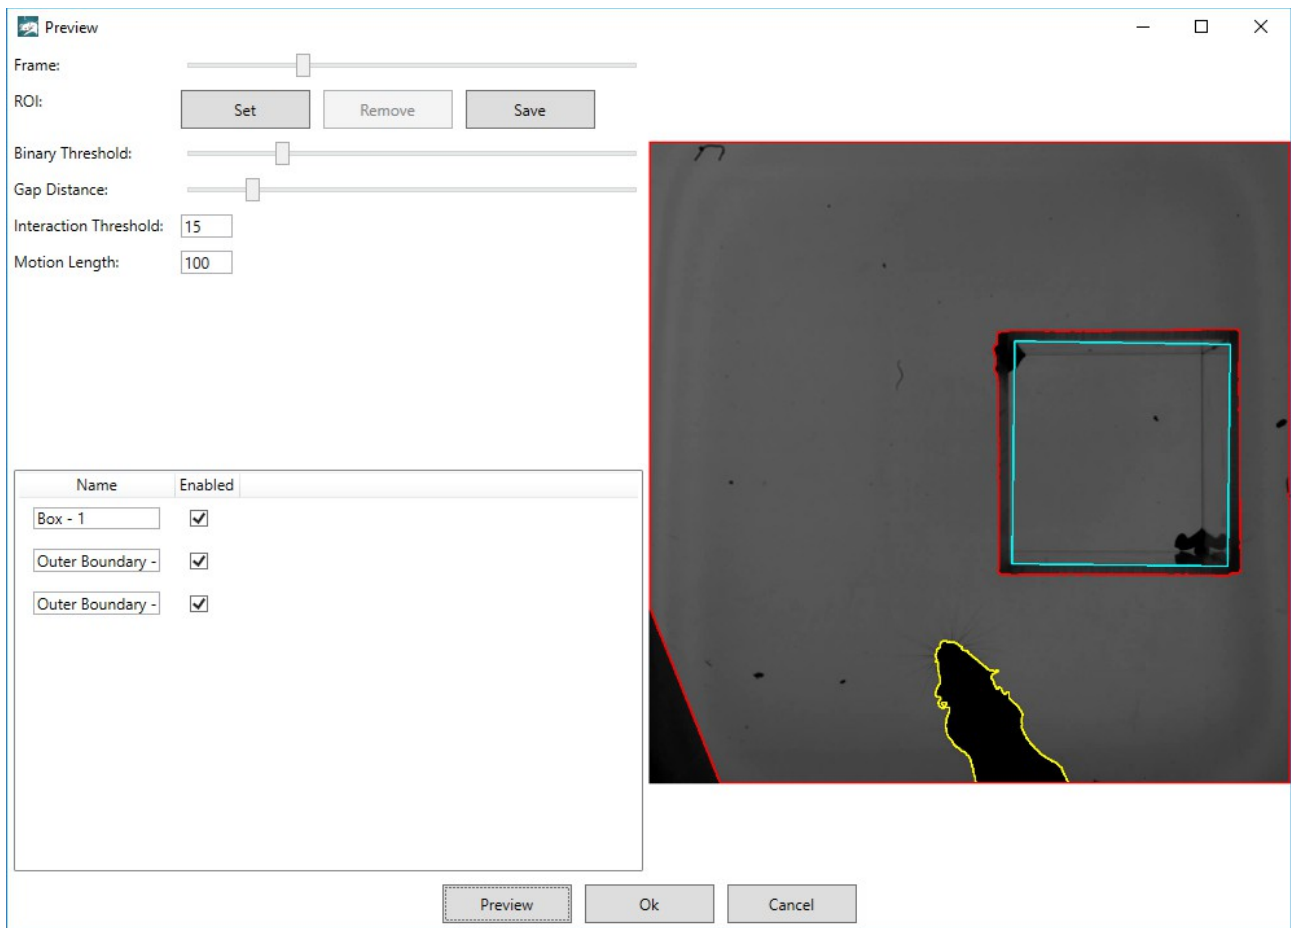

Fig 8 – Result from preview, the mouse (yellow) has been identified, and static objects (red and blue) have also been found.

Fig 9 – Result

The result after processing shows the motion track from the center of mass of the rodent, as well as nosetip location.
